Office Action Summary	Examiner	Art Unit				
	Mark Consilvio	2872				
The MAILING DATE of this communication appears on the cover sheet with the correspondence address Period for Reply						
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION. - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication. - If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely. - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication. - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

DETAILED ACTION

Information Disclosure Statement

The information disclosure statement (IDS) submitted on 10/31/2003 is in compliance with the provisions of 37 CFR 1.97. Accordingly, the information disclosure statement is being considered by the examiner.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1, 2, 5-10, 13-19 and 22-27 are rejected under 35 U.S.C. 103(a) as being unpatentable over Paschal (US Patent No. 6,116,741) in view of Horan et al. (US Patent No. 6,024,454).

With respect to claims 1, 14, 15, 22-24, and 27, firstly Paschal shows a microscope drape coupling system (200) comprising a first adapter (300) having a first objective lens barrel aperture (327) and a first mounting ring (325) coupled to the first adapter (300) (see figs. 1-4B). Also, Paschal shows the mounting ring (325) having a first mounting aperture (237) configured to couple the first adapter (300) to a first objective lens barrel (140) of a first microscope (100) (see figs. 1-4B). Further, Paschal shows a second adapter (450) having a second objective lens barrel aperture (427) and a second mounting ring (455) coupled to the second adapter (450) (see

Art Unit: 2872

figs. 1-4B). Though not expressly stated or numbered, Paschal clearly shows or implies a second mounting aperture configured to couple the second adapter to a second objective lens barrel of a second microscope (see figs. 4A and 4B and col. 6, lines 14-28). Further still, Paschal discloses the second mounting aperture having a diameter smaller than the first mounting aperture (see col. 6, lines 14-28). And finally Paschal shows a substantially flat transparent protective lens (310) such that a geometric normal to the transparent protective lens forms an angle with respect to a longitudinal axis of either the first or second objective lens barrel when the adapter is coupled to either the first or second objective lens barrel (see figs. 5A-5C).

While Paschal does not expressly disclose a housing for the protective lens (310), Paschal does show the lens held in place by a plurality of locking tabs (323) (see Paschal fig. 5A).

Paschal also shows each locking tab (323) comprises a tongue adapted to engage a groove for rotatably coupling the lens (310) to the first adapter (300) and the lens (310) is selectively removable from the first adapter (300) via the locking tabs (323) (see Paschal fig. 5A). Horan et al. shows a housing (30) for a flat transparent protective lens (34) having a plurality of locking tabs (36) disposed around a perimeter (32) thereof (see Horan et al. figs. 4 and 5). The examiner also notes that while the locking tabs and tongues of Paschal are formed on the adapter and the groove of Pascal is formed on the protective lens, the locking tabs (36) of Horan et al. are formed with a tongue-like tabs (36 in fig. 5) on the housing (30) and adapted to engage a groove (36 in fig. 4) formed on a coupling element (27). At the time the invention was made, it would have been obvious to a person of ordinary skill in the art to combine the teachings of Paschal and Horan et al. to provide a housing for the angled protective lens. One of ordinary skill in the art would have been motivated to do this allow the lens to be more easily handled during

Art Unit: 2872

replacement or cleaning and thus allowing the lens to be placed and cleaned without accidentally scratching or marking the surface of the lens. The examiner also notes that at the time the invention was made, it would have been obvious to a person of ordinary skill in the art to form the locking tabs on the housing and the groove on the adapter since it has been held that the reversal of parts is an obvious modification. *In re Gazda*, 219 F.2d 449, 104 USPQ 400 (CCPA 1955)

With respect to claims 2 and 19, Paschal discloses the first and second mounting rings are each formed from a flexible material such that the first and second mounting rings are each adapted to elastically constrict about the first and second objective lens barrels, respectively.

(See Paschal col. 5, lines 47-64)

With respect to claims 5, 16 and 25, Paschal shows the second adapter (450) comprises a plurality of protrusions (453) configured to rotatably couple the second adapter (450) to the first adapter (300) (see fig. 4B).

With respect to claims 17 and 26, Paschal shows the first adapter (300) further comprises an annular surface (320) disposed around a perimeter thereof, the annular surface (320) adapted to couple to a drape (210) (see figs. 2 and 3A).

With respect to claims 6-10 and 13, the examiner notes while Paschal and Horan et al. are silent to a method of using such a device, the steps of providing, coupling are very broad. Since the structure taught by Paschal and Horan et al. meets applicant's claimed limitations in claims 1, 2, 5, and 17, it would require only routine skill to use the structure to provide a sterile, sealed barrier against contamination by following the steps recited in claims 6-10, and 13.

Art Unit: 2872

Claims 3, 4, 11, 12, 20 and 21 are rejected under 35 U.S.C. 103(a) as being unpatentable over Paschal (US Patent No. 6,116,741) in view of Horan et al. (US Patent No. 6,024,454) and in further view of Treace (US Patent No. 3,528,720).

Page 5

With respect to claim 3, 4, 20, and 21, while Paschal and Horan et al. do not expressly disclose additional tabs to frictionally grip the objective barrel, it would take only routine skill in the art to substitute the resilient gasket of Paschal for any reasonable frictional gripping means. Treace provides evidence of and motivation for tab-like gripping means. Treace teaches a mounting ring (55) comprising a plurality of tabs (55a and 55b) extending inwardly from an objective lens barrel aperture (63), wherein a mounting aperture can be defined by the inside edges of each tab (see figs. 4 and 5 and col. 4, line 41-col. 5, line 17). Further, Treace discloses these tabs are desired to, "permit slight changes in the diameter of the frusto-conical body for accommodating various diameters of objective lens frames" and "affords a constricting resilient function to the annular body for frictionally securing the objective lens ring to a particular size telescope objective lens" (see col. 5, lines 10-17).

With respect to claims 11 and 12, the examiner notes while Paschal and Horan et al. are silent to a method of using such a device, the steps of providing, coupling are very broad. Since the structure taught by Paschal, Treace, and Horan et al. meets applicant's claimed limitations in claims 3 and 4, it would require only routine skill to use the structure to provide a sterile, sealed barrier against contamination by following the steps recited in claims 11 and 12.

Art Unit: 2872

Conclusion

Any inquiry concerning this communication or earlier communications from the

examiner should be directed to Mark Consilvio whose telephone number is (571) 272-2453. The

examiner can normally be reached on Monday thru Friday, 8:30 am to 5:00 pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Drew Dunn can be reached on (571) 272-2312. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR

system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
